It doesn't recognize two values next to each other as a multiplication; we always need to use an asterisk (*). Maxima treats e like any other variable variable: a , b , c , d , e , f. To get the constant, we need to use %e. Similarly, we would need to use %pi and %i to get those constants.

The instruction subst instructs Maxima to substitute a list of equations appearing as the first argument of subst , enclosed in square brackets, into the expression appearing as its second argument. Maxima 's default is to produce exact calculations, not numeric approximations. Thus, da/dt = 14400 .

Maxima distinguishes lower and upper case. All built-in functions have names which are lowercase only (sin, cos, save, load, etc). Built-in constants have lowercase names (%e, %pi, inf, etc). If you type SIN(x) or Sin(x), Maxima assumes you mean something other than the built-in sin function. User-de ned functions and variables can have names

Maxima is a computer algebra system, implemented in Lisp. Maxima is derived from the Macsyma system, developed at MIT in the years 1968 through 1982 as part of Project MAC. MIT turned over a copy of the Macsyma source code to the Department of Energy in 1982; that version is now known as DOE Macsyma. A copy of DOE

Einführung in Maxima
Maxima accepts real and complex numbers. Real numbers inMaxima can be integers, rationals, such as 3/5, orfloating-point numbers, for instance, 2.56 and 25.6e-1, whichis a short notation for25.6×10−1. Irrational numbers, suchas sqrt(2)(square root of 2) or log(2)(natural logarithm of 2) are left in that form, without beingapproximated by floating-point numbers, and latercalculations, such as sqrt(2)^2or exp(log(2))will lead to the exact result2.

Maxima is a command-line program that can use a network connection in order to communicate with a frontend. In data/wxmaxhtml.lisp wxMaxima teaches maxima to talk in a XML dialect: Maxima's normal output format is human-readable. But it can be tricked into containing strings that look like input or output labels and it doesn't guarantee that there is a way to transform output from maxima into a valid input again that has exactly the same meaning.

Numbers are thus just a special case. Hence Maxima can solve algebraic equations symbolically in the same way as we do it by hand. (%i1) solve(a*x^2+b*x+c=0,x); (%o1) [x = p b24ac+b 2a , x = p b24ac b 2a] Of course the coefficients and variables of this quadratic equation can be more complex expres- sions.
