### Designing with the Strut-and-Tie Method for Distribution

Strut and tie. Strut and tie modelling (STM) is a simple method which effectively expresses complex stress patterns as triangulated models. STM is based on truss analogy and can be applied to many elements of concrete structures.

strut-and-tie modeling in 2002 and 1994, respectively, for the design of deep beams or other regions of discontinuity. A strut-and-tie model (STM) idealizes the complex flow of stresses in a structural member as axial elements in a truss member. Concrete struts resist the compressive stress

### Strut-and-tie model design provisions

The Strut-Tie model is formulated by straight lines expressing resultant forces of tension and compression stress in members and its section. Therefore, the merit of the concept can be that the design engineer grasps the flow of the force in the members and proposes the rational reinforcing

As I discussed in this blog article Strut-and-tie A to Z, STM is a useful method in the analysis of the D regions in concrete structures.Today's case study is using STM to design a deep beam. This case is from Prof. James K. Wight's paper "Strut-and-tie model for deep beam design".First of all, I repeated the STM model of Prof. Wight, but converted all the English units into metric units.

### CE 72.52 - Lecture 7 - Strut and Tie Models

I ask because a lot of the strut and tie models in Appendix A "close" (for a lack of a better way to put it). A good example of that is the deep beam model they have: all the forces are connecting via nodes. I just have one node in my model. RE: Strut and tie model

Then create a strut and tie model with the ties matching your reinforcement locations. In your case, the right side reinforcement would probably placed horizontal with a hanger/corbel bracket at the dapped end. The STM will need more nodes here to include this flow of tension.

Strut-and-tie modelling is a simple method of modelling complex stress patterns in reinforced concrete as triangulated models. It is based on the same truss analogy as the design for shear in Eurocode 2 and can be applied to many elements. It is particularly useful where normal beam theory does not apply, i.e. where plane sections do not remain plane, e.g. in deep beams, corbels and pile caps.

After the Novak model, Reineck proposed and investigated several different strut-and-tie models, as shown in Fig. 3.The model in Fig. 3(a) is a variant of the Novak model. In addition, the models in Figs. (b) and (c) are obtained through a frame analysis, in which the upper beams are symmetrically supported and the lower beams are the same with each other.
